

Oil & gas development changes landscape structure

Configuration

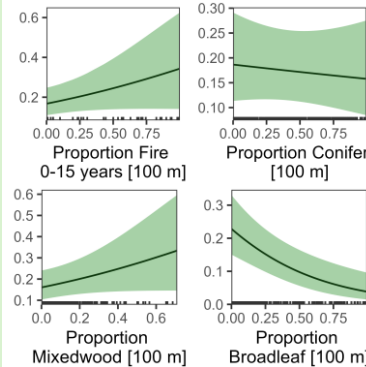

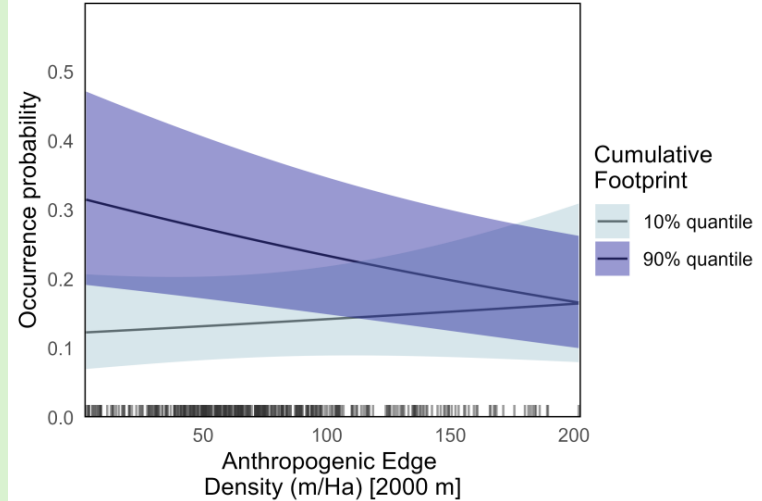

Composition

Red squirrel occurrence measured with camera traps

Model selection

Red squirrels are affected differently by industrial footprint and edge creation, likely due to:

- predation (-)
- resource complementation (+)

Oil & gas development changes landscape structure

Configuration

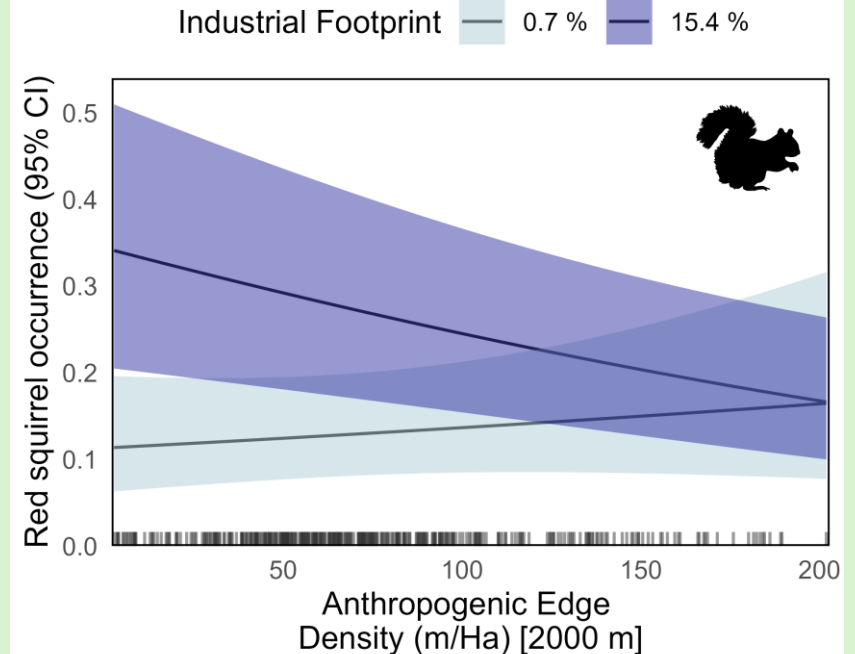

Composition

Red squirrel occurrence measured with camera traps

Model Selection

Footprint effect (+)

Resource
complementation

Edge effect (-)

Predation

The negative ecological impact of edge creation is context-dependent, intensifying as the cumulative industrial footprint in the surrounding landscape increases.
